

ABSTRACT

PROFILE OF ANTIHYPERTENSIVE DRUG USE IN PREGNANT WOMEN

PATIENTS

(Studies conducted in the Clinic X Surabaya in 2021)

Rhezita Tri Oktaviana

Preeclampsia can be defined by the presence of hypertension in pregnancy or when the gestational age exceeds 20 weeks and is followed by the occurrence of abnormalities in organs. Most pre-eclampsia is accompanied by proteinuria. This study aims to determine the profile of the use of antihypertensive drugs in pregnant women with preeclampsia at Clinic X Surabaya in 2021. The number of samples in this study was 52 patients. The results of the characteristics of pregnant women diagnosed with preeclampsia were more dominant in the age group 26-35 years as many as 40 patients (76.92%). The characteristic results of the most widely used antihypertensive drug therapy were the Alpha-Agonists class of antihypertensive drug therapy as many as 32 patients (61.54%). The results of the characteristics of the name of the most widely used antihypertensive drug were Methyldopa as many as 32 patients (61.54%). The result of the most widely used rule of thumb was Methyldopa 3 dd 1 as many as 32 patients (61.54%).

Keywords: pregnancy, preeclampsia and methyldopa.
